

### TYPICAL CONCENTRIC SLAVE TO CLUTCH FINGER IS 31.5MM

Measured with a wire gauge via the bell housing boot as shown, 31.5mm is expected, which allows upto 10mm of throw (only 8mm is needed). With the clutch pedal fully depressed, again measure with a wire gauge, this measurement should be at least 7.5mm to 8mm greater than the above measurement for a full disengagement to take place.
